

Radar Antenna

The INDERA Antenna Radar is the result of DTI engineering creations based on orders from our Clients. Its precise level can minimize the backless effect of the Antenna's rotation, along with the very smooth rotational movement when it is controlled. We designed it so that it could provide maximum support for the accuracy level of Indonesia's superior radar sensing function.

Similarly, the process of making Radom with a thickness of 2 mm with density and thickness are evenly distributed along the 1.8 m supports radar coverage function. With the range of capability coverage up to 64 Km.
